2.3.1. Výsledky na báze základného výskumu

Názov: *In-situ* a *in-operando* analýza perovskitových vrstiev pre aplikácie v optoelektronike

Autori: Naďa Mrkývková a kolektív autorov OMN (APVV-21-0297, APVV-19-0465, APVV-20-0111, VEGA 2/0046/21, VEGA 2/0041/21)

Abstrakt: Za posledné dva roky sme zdokonalili naše analytické techniky charakterizácie štruktúrnych a optoelektronických vlastností perovskitových vrstiev a zvýšili ich efektivitu kombináciou meraní rozptylu röntgenového žiarenia a fotoluminiscencie v reálnom čase, a to predovšetkým s využitím synchrotrónových zdrojov. To nám umožnilo priame pozorovanie procesov na nanoškále. Predovšetkým sme objasnili mechanizmus nukleácie a rastu tenkých perovskitových vrstiev vznikajúcich pomocou fyzikálnej depozície z plynnej fázy [1]. Táto štúdia identifikovala tri kritické fázy rastu: tvorbu izolovaných zárodkov, nasledovanú ich koalescenciou a ďalším rastom. Objasnili sme, ako tento spôsob rastu vedie k vzniku nežiarivých defektov na hraniciach zŕn, ktoré obmedzujú účinnosť perovskitových solárnych článkov. Okrem synchrotrónového žiarenia sme využili aj mikrofokusné zdroje na experimenty širokouhlého rozptylu röntgenového žiarenia (GIWAXS) v laboratórnych podmienkach, a to na skúmanie štruktúry a textúry perovskitových tenkých vrstiev pre jednoduché perovskitové solárne články [2] a tandemové solárne články využívajúce kombináciu kremíkových a perovskitových absorbérov [3]. Objasnili sme tiež tvorbu fáz v zmiešaných 3D/2D halidových perovskitových vrstvách pre aplikácie do fotodetektorov [4,5].

2.3.2. Výsledky aplikačného typu

Názov: Nový typ malých molekúl tiazolo[5,4-d]tiazolov so spirobifluorénovou skupinou pre organické emitéry v oblati žltého svetla

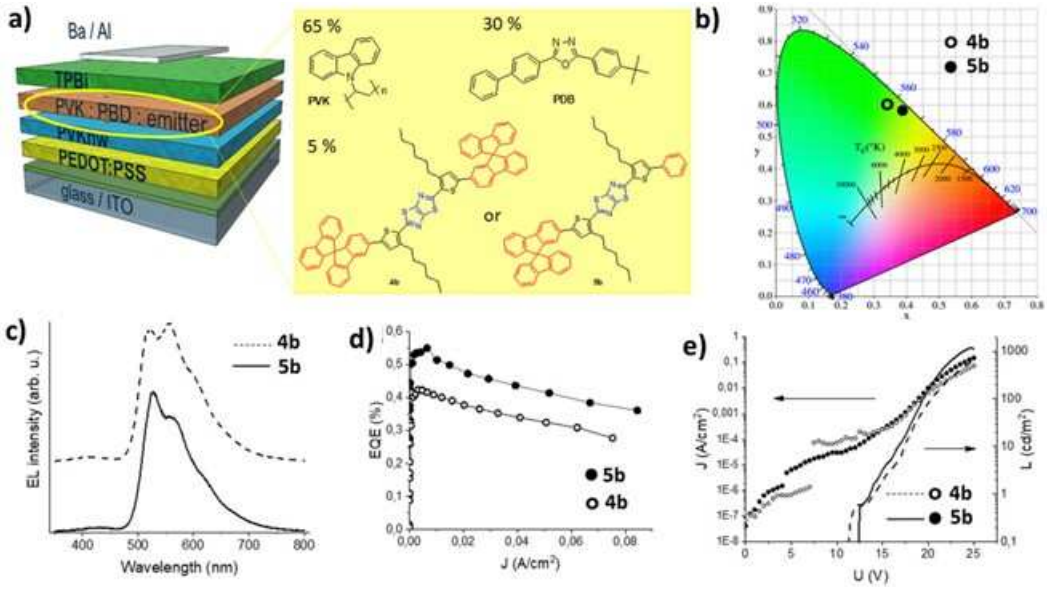
Autori: Kamil Tokár a kol. (VEGA 2/0055/21; APVV No. 19-0087; APVV no. 19-0338; ITMS projects 313021T081 & 313011W085 supported by the Research & Innovation Operational Program funded by the ERDF; PRACE Fenix Infrastructure resources at TGCC partially funded from the European Union's Horizon 2020 research and innovation programme through the ICEI grant agreement No. 800858)

Abstrakt: Súčasné organické svetloemitujúce OLEDy komerčného charakteru využívajú emisiu červeného, zeleného a modrého svetla v RGB(Y) displejoch. Avšak, tieto sú tvorené hlavne fosforescentnými organo-kovovými derivátmi obsahujúce irídium a predstavujú staršiu generáciu emitérov, pričom ich syntéza je pomerne drahá.

V práci bola navrhnutá a realizovaná pomocou trojkrokovej organickej syntézy séria tiazolo[5,4-d]tiazolov s bipolárnym (e-h) charakterom. Organické štruktúry pozostávajú z centrálneho tiazolo[5,4-d]tiazolu ako akceptora (A) a terminálnej, aspoň jednej spirobifluorénovej

skupiny ako donora (D) elektrónov. Obidve časti sú prepojené tiofénovým π-linkerom. Stredne veľký π systém je nevyhnutný na dosiahnutie emisie svetla s vlnovou dĺžkou zodpovedajúcou žltej farbe.

Pripravené molekuly sú plne π -konjugované na zabezpečenie podmienky prekrytia hraničných molekulových orbitálov (FMO). Nové zlúčeniny vykazujú potrebné elektronické vlastnosti s energetickými medzerami v intervale 2.5–3.0 eV. Tieto relatívne malé molekuly sa vyznačujú dobrou tepelnou stabilitou a fotofyzikálnymi vlastnosťami vhodnými pre aplikácie v optoelektronických materiáloch. Pri integrácii do laboratórne pripravených elektroluminiscenčných zariadení, ako hostiteľských materiálov, vykazovali emisiu svetla v žlto-zelenej oblasti spektra, čo je jedinečné pri malých organických molekulách. To predstavuje potenciál pri vývoji nových nízkohmotnostných a plne organických dopantov pre elektroluminiscenčné prvky. Emitéry na báze takýchto malých molekúl predstavujú oveľa lacnejšiu analógiu organo-kovových derivátov príp. polymérov, pričom ich východiskové látky sú relatívne ľahko dostupné.



Obr. Charakteristiky elektroluminiscenčného prípravku laboratórneho OLED-u, obsahujúceho symetrický derivát **4b** a asymetrickú zlúčeninu **5b** ako hostiteľský materiál emisnej vrstvy – schéma vzorky a výsledná chemická štruktúra hostiteľského materiálu (pre elektrónové-dierové transportné vrstvy (ETL/HTL) sú zakrúžkované červene) a), CIE (de L'Eclairage súradnice medzinárodnej farebnej škály) pre prípravok s **4b** vrstvou sa vzťahuje na žltkavo-zelené (x = 0,321, y = 0,602), prípravok s aplikovanou zlúčeninou **5b** emituje žltozelené svetlo (x = 0,354, y = 0,569) b). Elektroluminiscenčný prvok (EL) obsahujúci **5b** komponent vykazuje lepšie opto-elektronické charakteristiky v zmysle c) elektroluminiscenčnej intenzity pri 16 V, d) externej kvantovej účinnosti (EQE) a napokon e) maximálnej svietivosti pri spínacom napätí 11 V (**4b**)/12 V (**5b**).

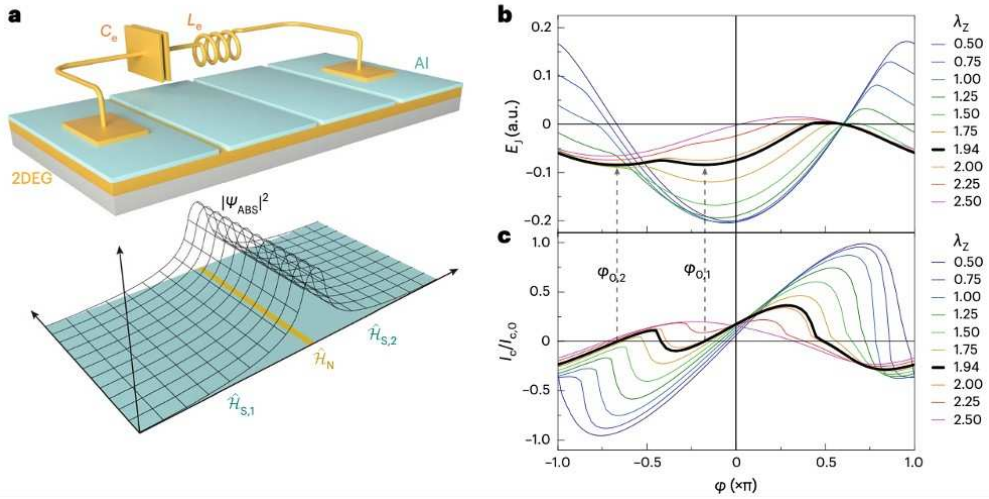
2.3.3. Výsledky na báze medzinárodnej spolupráce

Názov: Supercurrent diodes

Autori: Denis Kochan a kol. (IMPULZ)

Abstrakt: Nedávny objav vlastného supravodivého diódového efektu a jeho okamžité pozorovanie v bohatej škále systémov ukázali, že nereciprocné supravodiče prirodzene vznikajú pri porušení priestorovo-inverznej aj časovo-inverznej symetrie. V Josephsonových prechodoch možno nereciprocný supravodič pohodlne opísať v termínoch spinovo rozštiepených Andreevových stavov. V nominovaných prácach sme demonštrovali obrátenie znamienka Josephsonovej indukčnosti a jej magnetochirálnu anizotropiu - bezprecedentný prejav supravodičiového diódového efektu a stále nevysvetlený prechod podobný 0-π. Asymetria Josephsonovej indukčnosti ako funkcie supravodivosti nám umožnila skúmať vzťah medzi prúdom a fázou v blízkosti rovnovážneho stavu a skúmať skoky v základnom stave prechodu. Pomocou minimálneho teoretického modelu sme prepojili zmenu znamienka magnetochirálnej anizotropie indukčnosti s takzvaným 0-π-ako prechodom, predpovedanou, ale stále nevysvetlenou vlastnosťou viackanálových prechodov. Naše výsledky dokazujú potenciál meraní indukčnosti ako citlivej sondy základných vlastností nekonvenčných Josephsonových prechodov.



Obr. Viackanálové Josephsonove spoje: experiment a teória.
a) Hore; náčrt experimentálneho zariadenia, ktoré pozostáva z 1D Josephsonovho spoja v sérii s LC obvodom. Supravodivé oblasti pozostávajú z 2D elektrónového plynu (2DEG; žltá farba) ktorý je proximitizovaný Al ostrovmi (tyrkysová farba); sú spojené slabými spojmi 2DEG, ktoré sú označené medzerami medzi Al ostrovmi.
Dole; teoretický model: 2D Rashba supravodič (tyrkysová), Andreevova vlnová funkcia viazaného stavu Ψ_{ABS} (čierne čiary znázorňujú jej absolútny štvorec) je silne lokalizovaná okolo bariéry a sprostredkúva prenos Cooperových párov.

b) Vypočítaná Josephsonova energia ako funkcia fázového rozdielu φ pre rôzne Zeemanove parametre λ_Z. Šípky označujú polohy dvoch relevantných energetických miním, ktoré su degenerované pre λ_Z =1,94 (hrubá čierna krivka), keď nastáva v systéme 0--π-like prechod.
c) Vypočítané vzťahy medzi prúdom a fázou pre Zeemanove parametre uvažované v bode b; prúd je normalizovaný v jednotkách kritického prúdu pre Josephsonov spoj v nulovom magnetickom poli.

SURFINT-SREN VIII – Progress in Applied Surface, Interface and Thin Film Science, Bratislava, Slovensko, 20.11.-23.11.2023
The main goal of the conference is to contribute to new knowledge in surface, interface, ultra-thin films and very-thin films science of inorganic and organic materials by the most rapid interactive manner - by direct communication among scientists of corresponding research fields. The list of topics indicates that conference interests cover the development of basic theoretical physical and chemical principles and performance of surfaces-, thin films-, and interface-related procedures, and corresponding experimental research on atomic scale. Topical results are applied at development of new inventive industrial equipment needed for investigation of electrical, optical, and structural properties, and other parameters of atomic-size research objects. The conference range spreads, from physical point of view, from fundamental research done on sub-atomic and quantum level to production of devices built on new physical principles. The conference topics include also presentation of principally new devices in following fields: solar cells, liquid crystal displays, high-temperature superconductivity, and sensors. During the event, special attention will be given to evaluation of scientific and technical quality of works prepared by PhD students, to deep ecological meaning of solar cell energy production, and to exhibitions of companies.

7.7. Iné dôležité informácie o vedecko-organizačných a popularizačných aktivitách

V roku 2023 sa naši študenti a pracovníci zapájali do popularizácie vedy v mnohých oblastiach. Prehľad ich výstupov spolu s odkazmi na mediálne výstupy je k nahliadnutiu na našej webstránke **„My v médiách“** (https://fu.sav.sk/verejnost/my-v-mediach/).

V stručnosti spomenieme najvýznamnejšie podujatia. Pri oslavách 70 rokov založenia SAV, bol náš tím mladých pracovníkov prítomný počas **Víkendu SAV** 23. – 24. júna 2023 na námestí pred Euroveou. Tím pracoval v zložení: Adriana Annušová, Anna Kálosi, Denisa Lampášová, Andrej Liptaj, Simon Mičky, Andrej Špaček, Karol Végsö, Mário Ziman, organizáciu zabezpečovali Monika Bírová a Vladimír Held. Návštevníkom a záujemcom o fyziku v našom stánku demonštrovali vedecké expozície a praktické ukážky z pripravených exponátov. **Na Európskej noci výskumníkov** 29. 9. 2023 prezentovali niektorí z nich taktiež vedecký stánok Hra svetla.

V rámci podujatia Týždeň vedy a techniky na Slovensku, 6. — 12. 11. 2023 FÚ SAV, v. v. i. zorganizoval vlastný **„(Týž)Deň otvorených dverí na FÚ SAV 2023“** určený širokej verejnosti, ale najmä študentom stredných a vysokých škôl. Aktivita zahŕňala prednášky a návštevy špecializovaných laboratórií. DOD sa odohrával z časti v online priestore, kde boli verejnosti dopredu ponúknuté témy prednášok. Prednášky prebiehali na pôde Fyzikálneho ústavu, online a tiež formou návštevy na školách. Celkom sa uskutočnilo 10 osobitných prednášok našich pracovníkov na témy
Erik Bartoš: „Ako nám urýchľovače častíc uľahčujú život“
Monika Bírová: „Rádioaktivita okolo nás“
Andrej Liptaj: „Magnetická rezonancia“
Andrej Liptaj: „Fyzika hudby“
Martin Plesch: „Ako veci fungujú“
Kamil Tokár: „Sila gravitácie“

Podujatia DOD sa zúčastnili žiaci zo škôl v Bratislave a Novej Bane, prišli aj žiaci zo Vzdelávacieho centra v Stupave. Jednotlivcom boli prezentované prednášky podľa ich výberu a absolvovali návštevu laboratórií.

Do prehliadok laboratórií bolo zapojené Oddelenie multivrstiev a nanoštruktúr a Oddelenie fyziky kovov, menovite kolegyne a kolegovia Adriana Annušová, Naďa Mrkývková, Irena Gejdoš Janotová, Dušan Janičkovič, Peter Švec. Koordinátormi DOD boli Erik Bartoš a Andrej Liptaj.

13. Nadácie a fondy pri organizácii

14. Realizácia Koncepcie dlhodobého rozvoja a Akčného plánu organizácie

14.1. Odporúčania z posledného pravidelného (akreditačného) hodnotenia organizácií SAV

FÚ SAV, v. v. i. bol na základe hodnotenia medzinárodného Metapanelu zaradený do kategórie s charakteristikou:

"Výskum je viditeľný na európskej úrovni.
Organizácia prispieva hodnotnými výsledkami k rozvoju vednej oblasti v Európe"

a získal celkové ocenenie "B".
Na základe výsledkov akreditácie plánujeme identifikovať slabé a silné stránky ústavu. Jednotlivými radami ústavu budú vypracované príslušné smernice a vypracované body akčného plánu.

14.2. Hlavné body Akčného plánu organizácie a stav ich plnenia

V r. 2023 sme pokračovali v napĺňaní hlavných bodov akčného plánu činnosťami:

- Prijali sme osem nových PhD študentov, financovaných z rôznych zdrojov. Počty PhD študentov financovaných z centrálnych zdrojov SAV sa snažíma napĺňať na maximum, napriek zdĺhavejším administratívno-technickým problémom pri vybavovaní ich dokumentov.
- Prebehlo výberové konanie na ústavom financovanú pozíciu „IP SAS Fellow“ a pracovník nastúpil v priebehu roka na oddelenie jadrovej fyziky.
- Na základe vypracovej smernice, boli koncom roka špeciálne odmenené publikácie s vysokým impakt faktorom a s vysokým počtom citácií na jednu publikáciu.
- Pokračujeme v trende internacionalizácie ústavu, primárne najmä na úrovni doktorandov a postdoktorandov, snažíme sa udržať aj výskumných pracovníkov zo zahraničia. V tomto roku nám pomohlo štipendium pre excelentných výskumníkov ohrozených vojnovým konfliktom na Ukrajine.
- Pokračujeme v získavaní finančných prostriedkov z projektov z národných zdrojov (VEGA, APVV, Impulz). Zapojili sme sa do výziev Plánu obnovy: Štipendiá pre excelentných PhD. študentov (R1) a Štipendiá pre výskumníkov (R2 - R4).

14.3. Aktualizácia Akčného plánu organizácie v roku 2023

Počas roka nedošlo k novej aktualizácii akčného plánu, avšak Vedecká rada ústavu sa všeobecne zhodla na zriadení pracovnej skupiny pre vypracovanie Strategického a Akčného plánu FÚ SAV, v. v. i. V spolupráci s vedením ústavu a vedúcimi zamestnancami pripraví návrhy, ktoré budú slúžiť ako podklady nových dokumentov.

V roku 2023 sme zlepšili naše odborné znalosti pri sledovaní uhlíkových látok na vzorkách pomocou skenovacej infračervenej optickej mikroskopie v blízkom poli (SNOM). Pomocou tejto techniky je možné merať FTIR spektrá s priestorovým rozlíšením až do 20 nm. Okrem toho môžeme mapovať priestorové rozloženie rôznych molekulových vibrácií naladených na unikátnu absorpčnú čiaru v infračervenej oblasti pri súčasnom skenovaní vzorky. Tento prístup môže výrazne prispieť k lepšej lokalizácii rôznych druhov uhlíka pri veľmi nízkych koncentráciách.

V roku 2023 sme sa zamerali na sledovanie vplyvu povrchovo aktívnych látok na báze uhlíka, ktorými sú obalené nanočastice Au. Vykonali sme in-situ experimenty maloúhlového rozptylu röntgenového žiarenia priamo v Langmuirovom korýtku s monovrstvou Au nanočastíc. Po výmene molekúl povrchovo aktívnej látky sme sledovali zmenu medzičasticovej vzdialenosti v reálnom čase. Táto štúdia má význam pre vývoj plazmonicky aktívnych nanoštruktúr, ktoré sa môžu v

budúcnosti využiť v optoelektronike.

V roku 2023 sme sa podieľali na vývoji efektívneho výrobného postupu na dosiahnutie perovskitového obrazového čipu s vysokým rozlíšením, ktorý je kľúčový pre veľké zariadenia s flexibilnými obrazovými snímačmi. V tejto štúdii bolo demonštrované vysoké rozlíšenie a stabilné 10 × 10 flexibilné pole fotodetektora založené na formamidíniovom (FA+) a fenylmetylamóniovom (PMA+) kvázi-2D (PMA)2FAPb2I7 (n = 2) perovskite pomocou vývoja procesu hydrofóbnej a hydrofilnej úpravy s asistenciou SiO2 na PET substráte. Inkorporácia nanočastíc Au (Au NPs) zlepšila kvalitu perovskitového filmu a znížila počet hraníc zŕn. Mechanizmus, ktorým Au NPs zlepšujú fotoelektrickú kvalitu perovskitu, sa odhalil najmä pomocou optickej emisnej spektroskopie (GD-OES) a širokouhlého RTG rozptylu (GIWAXS). Na ďalšie zlepšenie fotoelektrických vlastností zariadení sa použila stratégia následnej úpravy chloridom formamidínia (FACl).

Dosiahnuté výsledky:
V roku 2023 sme sa zamerali na zlepšenie účinnosti konverzie energie (PCE) perovskitových solárnych článkov (PSC) pomocou nízkorozmerných MXénov. Vyššia PCE u PSC s ETL SnO2 modifikovanou MXénom je výsledkom dvoch efektov - zvýšenej elektrickej vodivosti modifikovanej ETL (elektrónovej transportnej vrstvy) a jej lepšej kryštalinity v zmysle väčšej veľkosti zŕn, čo znižuje celkovú plochu rozhrania a rekombináciu náboja v pascových stavoch vytvorených na hraniciach zŕn. Steady state a časovo rozlíšená fotoluminiscencia tiež naznačujú efektívnejší transport elektrónov k ITO elektróde v ETL SnO2 modifikovanej MXénom.

Na základe experimentov a predselekcie z predošlej etapy riešenia sme sa spoločne s partnerom IMDEA Nanociencia zamerali na prípravu a skúmanie systmému (FeNi)-P13C7 a jeho modifikácie bez obsaku uhlíka. Pomocou rýchleho ochladenia taveniny sme pripravili sériu zložení s obsahom fosforu 20, 17 a 14 at. % pri zachovaní ekviatomárneho pomeru Fe a Ni. Zmapovali sme vývoj štruktury pri kryštalizácii z amorfného stavu v závislosti od teploty, času a typu žíhania a z jednotlivých oblastí fázových zmien sme vybrali najperspektívnejšie režimy termomagnetického spracovania. Paralelne so štruktúrnou analýzou vrátane detailnej analýzy a prvkového mapovania a chemického usporiadania na atomárnej úrovni sme v spolupráci s ÚEF SAV zmerali relevantné magnetické parametre vzoriek. Na práci sa aktívne spolupracovali s partnerom IMDEA (dlhodobý viacnásobný pobyt doktoranda z IMDEA na našom pracovisku), ktorý zabezpečil štruktúrnu analýzu na synchrotróne Alba. Parciálne výsledky z výskumu v oblasti permanentných magnetov bez strategických prvkov sme prezentovali na konferenciách (1 pozvané keynote prednáška – konf. HighMatTech-2023, 2 pozvané prednášky – konf. RQ17, konf. ICSM 2023 a poster – APCOM 2023 zameraný na systém AlMn).

Dosiahnuté výsledky:
V tomto roku sme sa sústredili na odladťovanie depozičných parametrov pre rast tenkých hybridných perovskitových vrstiev FAMAPbI. Rast perovskitových vrstiev sme následne skúmali pomocou RTG difrakčných metód (GIWAXS) a fotoluminiscencie (PL). Kombinácia týchto dvoch rozličných metód umožnila sledovať zmeny optoelektronických ako aj štrukturálnych/kryštalografických vlastností. Namerané výsledky sme diskutovali s partnermi z Fyzikálneho ústavu AV ČR, ktorí majú neporovnateľne väčšie skúsenosti s analýzov PL spektier ako naša skupina. Spoločne sme dáta analyzovali, pričom sa nám podarilo určiť hodnotu Urbachovej energie počas rastu hybridných tenkých perovskitových vrstiev.

Získané výsledky boli zaslané do vedeckého časopisu Adv. Energy Materials (momentálne v recenznom riadení), opublikované v 3 CC článkoch a prezentované na medzinárodných konferenciách PSCO 2023 a HOPV 2023 v UK a na domácej konferencii NFA 2023 v Košiciach.

Dosiahnuté výsledky:
Zaoberali sme sa skúmaním tlmených oscilujúcich štruktúr, ktoré boli nedávno odhalené trojparametrickou formulou z protónových „efektívnych“ údajov pre formfaktory extrahované z nameraného celkového účinného prierezu anihilácie elektrónov a pozitrónov na pár protón-antiprotón. Dohady o ich priamom prejave kvark-gluónovej štruktúry pre protón naznačujú, že nie sú špecifické len pre protón a neutrón, ale majú byť vlastné aj ostatným hadrónom. Preto existuje možnosť, že použitím podobnej procedúry ako v prípade protónov, môžu byť tieto štruktúry nájdené aj u iných hadrónov. V súbore prác sme sa venovali ich objasneniu a prípadnému potvrdeniu v prípade nabitých a neutrálnych K-mezónov ako aj nabitých piónov. Výsledky indikujú, že spomenuté oscilujúce štruktúry sú len artefaktom použitej parametrizácie a nemôžu popísať namerané údaje s dostatočnou presnosťou.
V prehľadovom príspevku bol súhrnne prezentovaný kovariantný kvarkový model a prehľad jeho aplikácií pri popise vybraných rozpadových procesov B mezónov v troch kategóriách: leptónových, semileptónových a non-leptónových procesoch.
Výsledky boli publikované v troch publikáciách a v dvoch príspevkoch na konferenciách.

Dosiahnuté výsledky:
Vyvinuli sme mnohostavový spinový model tenzorovej siete, v ktorom sa realizuje anizotropná deformácia spinových interakcií. Definovali sme transformáciu 6-stavového clock modelu, pri ktorej dochádza k postupnému zoslabovaniu fázových prechodov nekonečného rádu v trikritickom bode. Ukázali sme zánik fázové prechody nekonečného rádu s postupnou zmenou na nespojitý prechod prvého rádu. Klasifikovali sme triedu univerzality trikritického bodu a načrtli možné scenáre vzniku fázových prechodov tretieho a vyššieho rádu. Model s anizotropnou deformáciou ponúka špecifický pohľad na tri základné typy fázových prechodov a je motiváciou pre experimentálne merania [Physica A 624 (2023) 128907].

Určovanie globálnych a lokálnych vlastností fyzikálnych systémov je základnou vlastnosťou analýzy rôznych systémov (materiálov). Zamerali sme sa na netriviálne vlastnosti fraktálnych štruktúr, kde lokálne merania vedú k diametrálne odlišným výsledkom. Použili sme tzv. „automatickú diferenciáciu“ tenzorovej siete, v ktorej sme zadefinovali spôsob globálneho merania magnetizácie. Na tejto fraktálnej štruktúre sme veľmi presne klasifikovali triedu univerzality [Phys. Rev. E 107 (2023) 044108].

Nosné experimenty v zahraničí (JYFL, Fínsko) boli úspešne zrealizované. Analýzou dát z experimentu JR151 sme potvrdili správnosť de-excitačnej schémy pre nízko ležiace rotačné štruktúry v Bi-191 ako aj existenciu 13/2+ izoméru vrátane jeho charakteristík. Dôležitým výsledkom je identifikácia kandidáta na nový izomérny stav so spinom a paritou 29/2- a dobou polpremeny ~500 ns v Bi-191. V rámci experimentu M20 zameraného na štúdium izomérnych stavov v izotope Au-179u bol vyvinutý ToF systém pod našim vedením, v spolupráci s FMFI UK, a bol využitý na potlačenie pozadia a identifikáciu žiarenia pochádzajúceho z krátko žijúcich izomérnych stavov. O.i., sme identifikovali nové rozpadové vetvy 2.2 μs izoméru a objavili nový izomér. Súvisiacim výsledkom je schválenie dvoch experimentov programovou komisiou JYFL, Fínsko v celkovej dĺžke tri týždne zväzkového času.

V roku 2023 sme na Oddelení jadrovej fyziky FÚ SAV, v. v. i., realizovali R&D nového modulu elektronického adaptéra na konverziu signálov z kremíkových drift detektorov (SDD) s resetovacím predzosilňovačom na impulzy podobné ako z konvenčných germániových detektorov typu HPGe, REGe. Tieto moduly boli skonštruované pre účely výskumného projektu s mionickými zväzkami pod názvom muX v Inštitúte Paula Scherrera (PSI) vo Villigene, Švajčiarsko. Moduly boli úspešne otestované a následne použité v troch po sebe idúcich experimentoch v PSI.

Na domácom pracovisku v Piešťanoch boli vyriešené všetky technické výzvy. Bol skonštruovaný

goniometer na meranie uhlových rozdelení a lineárnej polarizácie emitovaných gama kvánt ako aj teleskopický kremíkový detektor pre účely meraní v domácom laboratóriu. Ďalší vývoj v súvislosti s konštrukciou plynového terča viedol k úspešnej realizácii niekoľkých meraní, vrátane zahraničnej kolaborácie a schváleniu nového APVV projektu pre aplikovaný výskum.

Vylepšenie programov na výpočty excitovaných stavov pomocou Skyrme QRPA v sférických a axiálne-deformovaných jadrách, ktoré boli použité v nedávnych publikáciách na porovnanie a interpretáciu experimentálnych dát o E0, E1 a M1 excitáciách.

Počas riešenia projektu boli školení 3 bakalári (1 x Ž, 2 x M; doteraz obhájení: 2) , 4 diplomanti (3 x Ž, 1 x M; doteraz obhájené: 2) a 5 doktorandi (2 x Ž, 3 x M; doteraz obhájení: 2) a 1 post-doc.

Počas celého riešenia projektu bolo opublikovaných 18 prác kat. ADC (z toho 5 v r. 2023), 2 konferenčné príspevky a jedna publikácia kat. ADC je aktuálne v tlači.

V súlade s harmonogramom projektu sme počas druhého roku riešenia projektu pokračovali vo výskume antimikrobiálneho efektu MoOx nanočastíc a 2D MXenes nanočastíc na báze Ti3C2 v kombinácii s monoterpenoidovými zlúčeninami - thymol a carvacrol (nanokonjugáty) voči vybraným druhom baktérií. Antimikrobiálnu aktivitu sme monitorovali v podmienkach in vitro na baktérie Escherichia coli a S.aureus pomocou disk-difúznych testov citlivosti mikroorganizmov ako aj antibiofilmovej aktivity -inhibícia rastu buniek mikrobiálneho biofilmu. Pre MXény sme zaznamenali nízku inhibíciu rastu buniek narozdiel od MoOx nanočastíc, kde sme zaznamenali významnú inhibíciu rastu buniek. Z tohto dôvodu sme ďalej nepokračovali s monitorovaním antimikrobiálnej aktivity na MXénoch. Zamerali sme sa na iný druh 2D nanomateriálu- MoS2 nanočastice. Stanovili sme vhodnú koncentráciu monoterpenoidových zlúčenín pre prípravu nanokonjugátov s nanočasticammi MoOx a MoS2. Na základe in vitro testov sme monitorovali antimikrobiálny efekt nanočastíc a nanokonjugátov priamo na povrchu substrátu- mäkké a tvrdé drevo (dub a smrekovec). Pre zvýšenie antimikrobiálneho efektu nanomateriálu sme povrch substrátu vystavili pôsobeniu lasera s vlnovou dĺžkou 808 nm na vyvolanie fototermálneho efektu nanočastíc. Termo-kamerou sme sledovali nárast teploty povrchu materiálu a vplyv teploty na mikrobiálnu aktivitu [Molecules 28 (2023) 1018].

Chemoodporové senzory plynov a pár a inteligentné senzorové nano-polia (tiež elektronické nosy) majú vysoký aplikačný potenciál v miniaturizácii zariadení [11th Int. Conf. ADEPT]. Napríklad detektor stopových koncentrácií acetónových pár by pacientom s diabetes umožňoval samostatné monitorovanie ich zdravotného stavu.
Napriek množstvu študovaných systémov detegovaný plyn/senzor (obvyklým aktívnym prvkom senzoru sú nano-štruktúrované tenké filmy na báze polovodivých oxidov kovov), neexistuje experimentálne overený konsenzus o mechanizme detekcie, t. j. príčiny zmeny odporu senzora. Navrhli sme a vykonali in-operando štúdiu pomocou röntgenovej absorpčnej spektroskopie [10.1016/j.tsf.2023.140120] skúmajúcu chemickú štruktúru nanočastíc oxidu železa (NPs) vystavených stopovým koncentráciám pár acetónu, čiže pri reálnych pracovných podmienkach senzora. Zistili sme, že NPs oxidu železa boli čiastočne redukované, pričom z redukcie vyplývajúca zmena povrchovej výstupnej práce bola identifikovaná ako určujúci faktor pre zmenu odporu, ktorý sa v nano-štruktúrovanom filme riadi tunelovacím mechanizmom vodivosti. Výsledok je v rozpore so štandardným pohľadom na mechanizmus detekcie, ktorý zmenu odporu vysvetľuje ako dôsledok vzniku oblastí priestorového náboja v samotných zrnách tenkého filmu.

Metóda dimenzionálnej redukcie Fokker-Planckovej rovnice v 2D kanáli s premennou šírkou 2h(x) na pozdĺžnu súradnicu x bola aplikovaná na systém s Janusovou časticou, t.j. poháňanou konštantnou silou f pôsobiacou náhodným smerom, daným difúzne rotujúcou časticou. Vhodné škálovanie priečnych koordinát y a uhla smeru hnacej sily nám umožnilo odvodiť 1D Fick-Jacobsovu rovnicu, rozšírenú priestorovo závislým difúznym koeficientom D(x) a efektívnym potenciálom -gamma(x), počítanými rekurzívne v malom škálovacom parametri. Tieto veličiny priamo určujú celkový tok častíc cez kanál, a tak umožňujú analyticky študovať ozubnicový (ratchet) efekt. V nami uvažovanom systéme vzniká pre asymetrické funkcie h(x); usmernený prúd klesá monotóne s kvadrátom pomeru translačnej a rotačnej difúznej konštanty. Výsledky sú publikované vo Phys. Rev. E.

Skúmali sme rozhranie elektrónovej transportnej vrstvy a perovskitu, ktoré významne ovplyvňuje funkcionalitu perovskitového solárneho článku. Pozorovali sme nárast perovskitových zŕn, ktoré rástli na vrstve SnO2 modifikovanej MXénmi. Zatiaľ nebol navrhnutý žiadny podrobný mechanizmus vysvetľujúci tento efekt. S cieľom analyzovať účinok modifikácie SnO2 ETL MXénmi na kryštalizáciu perovskitovej vrstvy deponovanej na ETL v reálnom čase, sme monitorovali kryštalizáciu počas žíhania perovskitovej vrstvy hneď po depozícii metódou in situ GIWAXS. Analýzy GISAXS potvrdili pozitívny efekt prítomnosti MXénov v SnO2 vrstve na veľkosť perovskitových zŕn. Časovo rozlíšené merania GIWAXS naznačujú, že prítomnosť MXénov v SnO2 vrstve spomaľuje kryštalizáciu a má za následok väčšie kryštalické zrná perovskitu.

Výskum sme zamerali na príčinu vysokej účinnosti organických solárnych článkov na báze zmesi PM6:Y6 (takmer 20%). Metódou energeticky rozlíšenej elektrochemickej impedančnej spektroskopie (ER-EIS) sme analyzovali distribúciu hustoty transportných stavov elektrónov a dier v čistých vrstvách PM6 a Y6, ako aj ich zmesi. Výsledky ukázali, že Coulombova väzbová energia generovaného elektrón-dierového páru v zmesi je ?150 meV. To je menej o 250 meV od očakávanej hodnoty. Komplementárne simulácie odhalili, prečo je teplotná závislosť foto-disociácie zanedbateľná a neodráža skutočnú väzbovú energiu. Dôvodom je fakt, že disociácia páru elektrón-diera v neusporiadanom systéme je viackrokový proces, ktorého aktivačná energia je o rád nižšia od väzbovej energie. Okrem toho, samotný proces prebehne skôr, ako stihnú stavy prenosu náboja zrekombinovať.
Na solárnych článkoch PM6:Y6 sme taktiež skúmali tepelne indukovanú degradáciu, ktorá sa prejavuje zmenšením napätia naprázdno a faktora plnenia. Zistili sme, že tieto nežiadúce efekty sú spôsobené poklesom disociácie párov elektrón-diera a účinnosti odvodu náboja k elektródam. Merania ER-EIS ukázali, že tepelne degradované vzorky majú vyššiu energetickú bariéru pre konverziu stavov prenosu náboja do stavu separovaných nosičov náboja.
Vyšetrovali sme štrukturálne defekty a vplyv substrátu na tvorbu defektných stavov v zakázanom páse malomolekulárneho polovodiča typu n (TNT-FEC), syntetizovaného na PF UK. Pomocou výpočtov DFT a DFTB sme analyzovali možnosť prítomnosti konformérov, ktoré môžu ovplyvňujú štrukturálne vlastnosti tenkých vrstiev tohto polovodiča.

Výsledky boli publikované v 3 CC časopisoch a 1 zborníku z konferencie.

Venovali sme sa hľadaniu základného stavu rovnakých nábojov medzi rovnobežnými platňami nabitými asymetricky homogénnym povrchovým nábojom. V predchádzajúcich spoločných prácach s francúzskymi a rakúskymi kolegami bolo ukázané, že náboje vytvárajú na platniach rôzne periodické ako aj neperiodické štruktúry s podozrením na kvázikryštály s pentagonálnou symetriou. Použitá počítačová metóda "učenie bez dozoru", ktorá je súčasťou širšieho spektra metód umelej inteligencie, nám umožnila odhaliť z obrovského množstva dát nové štruktúry na povrchoch platní.

Ďalej sme študovali základný stav častíc lokalizovaných v uzloch 3D mriežok, interagujúcich cez coulombovský, zovšeobecnený Rieszov a Lennard-Jonesov potenciál. Použili sme pritom nami rozvíjané analytické metódy sumovania cez mriežkové body pomocou integrálov caz Jacobiho theta funkcie.. Boli nájdené nové fázové prechody prvého a druhého druhu medzi 3D mriežkami pri spojitej zmene hustoty častíc.

Dokončila sa štúdia týkajúca sa návrhu nového kryoprezervačného protokolu pre zmrazovanie ľudských kožných buniek, ktorý by bol alternatívou pre klasický prístup využívajúci pomalé zmrazovanie a dimetylsulfoxid vnikajúci do vnútra buniek. Alternatívou bolo rýchle zmrazovanie s využitím polyetylénglykolu, ktorý nepreniká do buniek. Kryoprotektívny potenciál polyetylénglykolu bol preverený metódami diferenčnej kompenzačnej kalorimetrie, pozitrónovej anihilácie, optickej kryomikroskopie a Ramanovej spektroskopie. Výsledky týchto analýz potvrdili, že polyetylénglykol dostatočne potláča tvorbu ľadu, zamedzuje eutektickej kryštalizácii solí a vytvára stabilnú mikroštruktúru ľadu – čo je obzvlášť dôležité kritérium vzhľadom vysokú rýchlosť chladenia počas zmrazovania týmto novým kryoprezervačným protokolom. Ukázalo sa, že tento nový prístup má aplikačný potenciál keď analýza životaschopnosti buniek po ich rozmrazení ukázala podobnú úspešnosť medzi novým a štandardným prístupom. Praktický význam nového prístupu spočíva v jeho jednoduchosti keď zmrazovanie je vykonané priamym ponorením buniek do tekutého dusíka narozdieľ od potreby kontrolovaného chladenia v prípade štandardného protokolu. Ďalšou výhodou je jednoduchšie odstraňovanie polyetylénglykolu z buniek/bunkového média po rozmrazení – nakoľko polyetylénglykol neprechádza do vnútra buniek, jeho odstránenie je jednoduchšie s čím súvisí aj nižšie riziko osmotického zranenia buniek v týchto procedúrach

[Journal of Molecular Liquids].

Započala sa ďalšia štúdia [Cryobiology], ktorá sa zaoberala mechanizmom kryozranenia ľudských červených krviniek, ku ktorému dochádza počas pomalého zmrazovania – a sú potrebné vysoké koncentrácie kryoprotektívnej látky, typicky glycerol, na jej minimalizovanie.
Bolo ukázané, že experimentálne pozorovaný jav hromadenia soli vo vnútri buniek je možné vysvetliť aktiváciou iónových membránových transportných mechanizmov, ktoré sú prirodzene prítomné v plazmatickej membráne. Bolo tiež ukázané, že takto nahromadená soľ spôsobuje osmotickú lýzu buniek keď sú vrátené do izotonického média (v resp. sú rozmrazené z pohľadu samotného zmrazovania). Toto vysvetlenie je jedným z mála pokusov o inkorporáciu perspektívy bunkovej fyziológie do kryobiológie, a ukazuje sa, že má potenciál vysvetliť osmotické správanie širokej škály rôznych typov buniek. Práca bola opublikovaná v časopise Cryobiology.
V oblasti správania sa uväznených kvapalín bola navrhnutá a vykonaná štúdia ohľadom fázového správania vody a jej binárnych zmesí s dimetylsulfoxidom, formamidom a chloridom sodným. Bolo ukázané, že tieto zmesi možno rozdeliť do dvoch kategórií: organických (formamid, dimetylsulfoxid) a tých obsahujúcich soľ (NaCl). Tieto dve triedy binárnych zmesí vykazujú rozličné fázové správanie v uväznení na škále 4 až 8 nm cylindrických pórov matrice pozostávajúcej z SiO_2. Na základe termoanalytickej a mikroštruktúrnej analýzy pomocou metód diferenčnej kompenzačnej kalorimetrie a pozitrónovej anihilačnej spektroskopie sa ukázalo, že NaCl indukuje väčší pokles bodu mrazu oproti čistej vode v rovnakom uväznení ako organické molekuly, s čím súvisí aj menšie množstvo ľadu v tuhej fáze. Tento jav bol vysvetlený hypotézou o preferenčnej interakcii medzi povrchom steny póru, ktorý je pokrytý hydrofilnou silanolovou funkčnou skupinou (Si-OH), a organickými molekulami.

S cieľom overenia spevňujúceho efektu spojov bezolovnatých spájok typu SAC305 primiešaním uhlíkových nanosfér a nanorúrok sme pripravili spájku s aditivami týchto nanoobjektov. Nanoobjekty sme pre zvýšenie zmáčavosti spájkou čiastošne pokryli naprášenými vrstvami Au-Pd a Pt v špeciálne upravenom naprašovacom zariadení. Spojové páry Cu/spájka+nanoaditív/Cu sme okrem prirodzeného starnutia pri izbovej teplote vystavili aj teplote pod čiarou fázového prechodu Sn – viacmesačná expozícia pri teplote 253 K. Pomocou mechanických testov a štruktúrnej analýzy rezov spojov sme korelovali vývoj mikroštruktúry a morfológie fáz rozhrania spájka-Cu s mechanickými vlastnosťami, ukázali sme na rozdiely v morfológii rozhrania pri nízkych teplotách oproti spojom držaným pri izbovej teplote (publikácia v Applied Nanoscience, pozvaná "keynote" prednáška na konferencii HighMatTech-2023).

Preskúmali sme účinnosť metódy stredne rýchleho izotermického žíhania (jednotky až desiatky sekúnd) na zníženie koercivity v materiáloch s vysokou hodnotou magnetizácie v nasýtení na báze Fe-Cu-B-P-Si a Fe(Co)SnBP. Ukázali sme možnosť optimalizácie procesu nanokryštalizácie z rýchlochladeného amorfného stavu v kombinácii s optimalizáciou legovania nízkym obsahom vhodných prvkov na zabezpečenie nízkej koercivity bez straty magnetizácie v nasýtení, ktorá zostala na úrovni 1.8 T (publikácia v J. Magn. Magn. Mater.).

V sérii prác sme sa venovali využitiu prvoprincípových výpočtov na analýzu a predikciu experimentálne pozorovaných javov v aperiodických systémoch, kvázikryštáloch, klatrátoch a systémoch so špeciálnym usporiadaním a konfiguráciami zložiek v objeme alebo na rozhraniach. V rozsiahlej práci (Phys. Rev. B) sme skúmali pomocou DFT dekagonálne kváziperiodické usporiadanie tenkých vrstiev Sn na d-Al-Ni-Co na základe experimentálnych pozorovaní pomocou STM a LEEDS s ohľadom na možnú kváziperiodicitu deponovanej tenkej vrstvy Sn. Ukázali sme, že táto sa zachováva plne do hrúbky 1 nm a kváziperiodický motív je detekovateľný až do vzdialenosti 10 nm, kde je už efektívny potenciál substrátu zanedbatelne malý. Pozorovania sa podarilo vysvetliť modelom aproximantov klatrátu a zobecniť ho.

Rozvinuli sme metodiku selekcie zložení a prípravy vysokoentropických zliatin s využitím širokej škály ochladzovacích rýchlosti roztavenej zliatiny. Úpravou technológií prípravy bolo možné získať

kovové systémy HEA rýchlym ochladením taveniny, odlievaním do kónickej formy a podtlakovým liatím. Takto bolo možné získať sériu systémov na báze FeNiCoAlMn s meniacim sa obsahom Al/Mn a so substitúciou časti hlavných prvkov dodatočným legovaním inými atómami kovov. Ukázali sme, že je možné získať monofázové viaczložkové zliatiny v širšom koncentračnom intervale použitých prvkov (prednáška FEMS EUROMAT, poster RQ17).

Intenzívne sme v spolupráci preskúmali vysokoentropické systémy karbidov a boridov najmä s ohľadom na ich lokálne chemické a fázové zloženie. Naše výsledky chemického usporiadania na atomárnej úrovni poskytli informacie o variácii lokálneho chemického obsadzovania elementárnej bunky a pripelo k objasneniu unikátnych vlastností takýchto keramík (publikácie v . Int J Appl Ceram Technol., Advances in Applied Ceramics a pod.).

Počas tretieho roka riešenia sme pokračovali v štúdiu chemických postupov syntéz pre malé organické molekuly na báze tiazolo[5,4-d]tiazolov so spirobifluorénovými skupinami (SBF). Bola navrhnutá trojkroková organická syntéza séria tiazolo-tiazolov, molekúl s bipolárnym elektrónovo-dierovým charakterom (e-h). Pripravené molekuly sú plne ?-konjugované, čím je zabezpečená podmienka prekrytia hraničných molekulových orbitálov (FMO). Nové zlúčeniny vykazujú potrebné elektronické vlastnosti s energetickými medzerami ležiacimi v intervale 2.5–3.0 eV. Tieto relatívne malé molekuly sa zároveň vyznačujú dobrou tepelnou stabilitou.
Štruktúra molekúl pozostáva z centrálneho tiazolo[5,4-d]tiazolu ako akceptora (A) a terminálnych spirobifluorénych skupín (SBF) ako donora (D) elektrónov. Obidve časti sú prepojené tiofénovým π-linkerom čím tvoria D- π-A jednotky. Boli nasyntetizované dva typy elektrónovo-dierových transportných vrstiev (ETL/HTL) symetrický s dvomi SBF skupinami a asimetrický s jednou SBF v molekule. Tieto boli integrované ako emisné layere v laboratórne pripravenej OLED (organická dióda) štruktúre. Meraním ich elektroluminiscenčných vlastností sa zistilo, že oblasť ich svetelnej emisie spadá vlnovými dĺžkami do žltozelenej oblasti spektra.
Elektroluminiscenčný prvok (EL) obsahujúci asymetrický komponent s jednou SBF koncovou skupinou vykazuje lepšie opto-elektronické charakteristiky v zmysle elektroluminiscenčnej intenzity pri 16 V, externej kvantovej účinnosti (EQE) a napokon maximálnej svietivosti pri hraničnom napätí 12 V. Navrhnuté tiazolo[5,4-d]tiazolové struktúry SBF takto predstavujú potenciál pri vývoji nových nízkohmotnostných a plne organických dopantov pre elektroluminiscenčné prvky. Vrstvy na báze takýchto malých organických molekúl predstavujú oveľa lacnejšiu analógiu organo-kovových derivátov v EL prvkoch, pričom ich východiskové látky sú zároveň relatívne lacné a ľahko dostupné.

V teoretickej a modelovacej časti boli pomocou DFT a hybridných DFT metód s lokalizovanými

gaussovskými bázami simulované vlnové funkcie na single thiazol-thiazolových molekulách s rovnovážnymi geometriami. Boli vyprojektované ich hraničné molekulárne orbitály FMO, energetické hladiny a určené energetické medzery. DFT/TPSSh vypočítané polohy hladín HOMO/LUMO sa kvalitatívne zhodujú z nameranými pomocou cyklickej voltampérmetrie a sú posunuté ~0.5 eV k vyšším hodnotám. Vypočítané energetické medzery (Egap) zodpovedajú polohám experimentálne stanovených UVvis absorbčných maxím.
Experimentálne a simulačne interpretované výsledky z tejto etapy projektu boli odprezentované v 1 karentovanej publikácii, 4 medzinárodných konferenčných príspevkoch a 1 popularizačnej prednáške.

Výskum bol orientvaný na výskum tepelných vlastností drevených kompozitných mateiálov vo forme drevotrieskových dosiek. Na meranie boli použité prechodové metódy. Pomocou impulznej prechodovej metódy boli zmerané vlastnosti drevotrieskových dosiek na báze tureckého dubu a mixu štiepky pomarančovníka a buku. Vzorky boli pripravané s vysokou a strednou hustotou. Ďalšiou metódou bola Transient Plane Source ktorou sme vyšetrovali vzorku vyrobenú z 500rokov starého jedľového dreva. Táto vzorka bola vyrobená v tvare kociek čo umožnilo meranie vo všetkých troch smeroch anizotropie, teda v pozdĺžnom, priečnom a radiálnom smere. Merania potvrdili anizotropiu a rozdiel v pozdĺžnom smere voči ostatným bol až 30%.

Na vyhodnotenie meraní impulznou prechodovou metódou bol použitý kvádrový model zohľadňujúci okrajové rušivé efekty odvodu tepla z povrchu vzorky v laterálnom smere s presnou geometriou v tvare kvádra. Bol analyzovaný vplyv rôzneho výkonu impulzu aj pomocou koeficientov citlivosti. Výsledkom je poznatok že s rastúcou energiou impulzu narastá citlovsť meraní na jednotlivé parametre a teda aj pokles neurčitosti stanovenia voľných parametrov modelu. Avšak ďalším rušivým efektom je vplyv nerovnosti na rozhraniach jednotlivých častí zostavy vzorky. V tomto prípade sa jedná o tepelný odpor vzduchových medzier na rozhraniach . Zvyčajne sa rieši pomocou koeficientu pretupu tepla cez rozhrania, ale nanešťastie v prípade kádrového modelu nie je zohľadnený a preto spôsobuje efekt, ktorého veľkosť nevieme odhadnúť. Koeficient prestupu tepla je navyše teplotne závislý a jeho vplyv narastá so zvyšovaním energie impulzu a teda nárastom teploty na rozhraní zdroja tepla a vzorky a spôsobuje že nemôžeme presne nafitovať teplotnú odozvu na impulz. Preto pre tento typ meraní musíme optimalizovať experiment tak, že znížime energu impulzu za cenu zvýšenia veľkosti neurčitosti odhadu parametrov.

V prípade nerovných povrchov boli merania v na energii impulzov značne ovplyvnené popísaným efektom a hodnoty parametrov vykazovali značný rozptyl. Pri meraní vzorky dubu s vysokou hustotou kde boli povrchy rovné sa uvedený efekt neuplatnil a rozptyl dát zodpovedal bežnej

štatistickej chybe merania. V tomto prípade stanovené hodnoty parametrov neboli závislé na výkone impulzu, čo zodpovedá aj teroretickému predpokladu.
Výsledky výskumu boli publikované v 3 článkoch ktoré vyšli v r. 2023 (ELVYS). Ďalšie 2 články boli úspešne prijaté do zborníka z 28. medzinárodného stretnutia termofyziky 2023 a budú publikované v priebehu roka 2024 v AIP (American Institute of Publishing).

Pokračovali sme vo vývoji metódy SPDT pre prípravu presných zakrivených povrchov RTG optiky. Zamerali sme sa na zvýšenie presnosti tvaru konkávnych a konvexných Al foriem rôzneho polomeru ladením parametrov nanoobrábania. Presnosť tvaru a kvalitu povrchu sme merali hrotovou a optickou profilometriou, pričom nameraný profil bol porovnaný s teoretickou krivkou pre nominálny polomer. To umožnilo identifikovať lokálne odchýlky od ideálneho tvaru a poskytlo spätnú väzbu pre úpravu technológie. V najlepších prípadoch dosahovala lokálna odchýlka 0.1 mm pri polomere zakrivenia 1 m. Dosiahnuť túto presnosť na celej dĺžke profilu presiahne časový rámec projektu.

V prvej etape riešenia projektu sme aplikovali Konfokálnu Ramanovú mikroskopiu bez použitia fluorescenčných značiek na fixované bunky hMSC a MCF7, inkubované po dobu 1 až 21 dni s rôznymi koncentráciami solí železa (zdroj FeOx nanočastíc v bunke cez biosyntézu) a železooxidovými nanočasticami (Fe2O3 - maghemite), ktoré boli dodané partnerskou organizáciou Institut Curie, Paris. Následne sme študovali biosyntézu respektíve biodegradáciu železooxidových nanočastíc na základe Ramanových spektier. Okrem toho, sme sa zaoberali zvýšením internalizácie MoOx nanočastíc do rakovinových buniek, pomocou biomolekúl (Annušová et al 2023 v ACS Omega).

V roku 2023 sme sa bližšie zamerali na vlastnosti Ti3C2 a V4C3 MXene nanomateriálov, pred a po delaminácii. Ďalej sme charakterizovali ich fototermálne a SERS vlastnosti a zmeny vo fyzikálno-chemických vlastnostiach po funkcionalizácii biomolekulou selektívnou na hypoxický nádor. Takisto sme navrhli nekonvenčnú metódu, jednomolekulárnu silovú spektroskopiu (SMFS – Single Molecule Force Spectroscopy), na vyhodnotenie afinity špecifickej protilátky CAIX (M75) v rôznych typoch buniek. Testovali sme SMFS s Bruker Multimode8 AFM doplneným tekutou celou na popísanie väzby antigén-protilátka. Vyvinuli sme náš vlastný softvér (v Labview) na vyhodnotenie disociácie väzby antigén-protilátka a testovali sme ho na väzbe avidín-biotín. Hroty AFM boli funkcionalizované biotínom a vrstva avidínu bola pripravená na substráte Mica.

Práce na projekte v rámci roku 2023 primárne spadali do riešenia prvej etapy s názvom Návrh a realizácia radiačného tienenia laboratória v Piešťanoch. Z dostupnej dokumentácie lineárneho tandemového urýchľovača bol vypracovaná definícia zjednodušeného geometrického a materiálového modelu. Následne boli tieto údaje prevedené do syntaxe a štruktúry vhodnej pre simulačnú sekvenciu MAVRIC, ktorá je súčasťou systému ORNL SCALE. Relevantná časť práce bola venovaná aj výpočtovému určeniu anizotropie D(d,n)3He reakcie v plynovom terči.
V Urýchľovačovom laboratóriu Fyzikálneho ústavu SAV, v. v. i., bolo uskutočnených niekoľko aktivít s cieľom zabezpečiť plynulú a bezpečnú prevádzku počas budúcich experimentov. Tieto spočívali v optimalizácii iónového zdroja pre produkciu zväzku deuterónov a optiky urýchľovačovej trasy pre ich dopravenie k plynovému terču. Druhou nosnou časťou prác bol vývoj flexibilnejšieho plynového terča s účelom produkcie rýchlych neutrónov v reakcii D(d,n)3He.

Pokračovali sme v naparovaní organických molekúl - konkrétne pentacénu (PEN), a hybridných perovskitových vrtiev v modifikovanej vákuovej komore. Molekuly PEN sme naparovali na tenké MoS2 vrstvy s rôznou orientáciou atomárnych rovín. Z výskumu realizovaného v predošlých

rokoch vieme, že molekuly PEN sa orientujú rôzne v závislosti na orientácii atomárnych vrstiev substrátu na ktorom rastú. Takto narastené tenké vrstvy PEN s rôznou orientáciu molekúl - s dlhou osou orientovanou v rovine, resp. kolmo na rovinu substrátu - sme využili ako tzv. electron transporting layer (ETL), tj. polovodičovú vrstvu s funkciou zberu elektrónov a blokovania transportu dier k susediacej elektróde. Takéto ETL vrstvy sú nevyhnutné v solárnych článkoch na báze perovskitov. Na vrstvy PEN bola následne nadeponovaná tenká vrstva hybridného perovskitu (MAPbI). Naša depozičná komora umožňuje naparovanie viacerých materiálov súčasne, preto bolo možné perovskitovú vrstvu rásť priamo na vrstvu PEN, bez nutnosti transferu vzoriek, poprípade vystaveniu vzoriek kyslíkovej atmosmére.
Našim cieľom bolo sledovať štruktúrne a optoelektronické vlastnosti PEN aj MAPbI vrstvy, s dôrazom na to, či orientácia PEN molekúl ovplyvní vlastnosti perovskitovej vrstvy. Za týmto účelom sme využili metódy RTG difrakcie (GIWAXS, GISAXS) a fotoluminiscencie (PL). Namerané dáta v súčasnosti vyhodnocujeme a prvotné výsledky naznačujú že orientácia PEN molekúl neovplyvňuje štruktúrne vlastnosti, konkrétne orientáciu atomárnych rovín perovskitu.

V spolupráci so skupinou Prof. Keckesa (Univerzita Leoben) sme sa sústredili na štúdium stresu v FAMAPbI perovskitových vrstvách. Na charakterizáciu procesu rastu a odhalenie štruktúrnych vlastností, v reálnom čase sme použili simultánne merania GIWAXS a PL. Vysoká kvalita narastenej perovskitovej vrstvy bola potvrdená prítomnosťou Laueho oscilácií, ktoré sa počas depozície vyvinuli v difrakčných mapách. Pozorovali sme, že tvorba perovskitu FAMAPbI sa vyznačuje rozsiahlym posunom polohy PL píku v dôsledku rastu kryštálikov a nemonotónnym priebehom intenzity PL žiarenia. Ako sme zistili, tento nemonotónny vývoj úzko súvisí s morfológiou vrstvy, ktorá následne ovplyvňuje vnútorné napätie/stres. Typický vývoj vnútorného napätia príznačný pre rast Volmerovho-Weberovho typu ponúkol výnimočný pohľad na proces tvorby perovskitovej vrstvy. Najmä pozorovaný prechod zo stavu kompresívneho napätia do stavu ťahového ("tensile") pomohol určiť presný čas koalescencie jednotlivých perovskitových zŕn. Charakter pozorovaného napätia počas rastu perovskitovej vrstvy potvrdil vysvetlenie zhášania PL signálu. Ten sa dá interpretovať zvýšenou neradiačnou rekombináciou na hlbokých defektných stavoch v zakázanom páse, vytvorených na hraniciach zŕn susedných kryštálikov.

Získané výsledky boli spísané do článku "Evolution of defects, morphology, and strain during FAMAPbI3 perovskite vacuum deposition: Insight from in-situ photoluminescence and X-ray scattering " a zaslané do časopisu Advanced Energy Materials.

V prvom roku riešenia projektu sme optimalizovali podmienky prípravy batériového článku v usporiadaní medený kolektor / tuhý elektrolyt / kovové lítium. Tento typ článku využívame v elektrochemických experimentoch. Elektrochemická charakterizácia bola zameraná na elektrodepozíciu kovového lítia na medený kolektor v galvanostatickom režime. Cieľom bolo dosiahnuť časovo najdlhšiu depozíciu, ktorú ovplyvňuje prúdová hustota a tlak aplikovaný na článok.
Ďalšou aktivitou bol vývoj dvoch prototypov batériových článkov vhodných pre štúdium elektrodepozície a elektrorozpúšťania kovového lítia na kovovom kolektore. Prvý prototyp je vhodný na sledovanie distribúcie stresu v tuho-fázovej batérii v statickom režime ako aj počas cyklovania batérie. Tento prototyp umožňuje merať distribúciu stresu v bočnom priereze batérie. Rôzne vyvíjané verzie boli následne testované v laboratórnych podmienkach (Slovensko, Nemecko DESY). Na základe vyhodnotených údajov budú navrhnuté zmeny dizajnu a zloženia batériového článku. Druhý prototyp je určený na priame sledovanie nukluácie kovového lítia a procesov spojených s jeho elektrodepozícou. Dizajn článku dovoľuje sledovať nukleáciu cez optické sklo na povrchu kovového kolektora. V súčasnosti sa dokončuje technické riešenie a optimalizácia skladania článku.

Vplyv modifikácie Ti3C2Tx MXénov na elektrónovú transportnú vrstvu (ETL) SnO2 sa skúmal v rozsahu koncentrácií 0-7,4 % hm. MXénu. Zvýšená elektrická vodivosť a elektrónová selektivita pre ETL SnO2 modifikovanú MXénom sa potvrdila až do 1 wt % MXénu. Pri 7,4 % hm. MXénu sa zistilo výrazné potlačenie vlastnosti ETL blokovať diery. Zvýšenie účinnosti konverzie energie zo 17,4 % na 18,3 % základného perovskitového solárneho článku s metylamónium-olovnatým jodidom po modifikácii SnO2 ETL s 0,1 % hmotn. MXénu je dôsledkom dvoch príspevkov - zvýšenej elektrickej vodivosti ETL a zlepšenej kryštalinity a väčšej veľkosti zŕn v porovnaní s čistým SnO2 ETL, čo znižuje celkovú hraničnú plochu a rekombináciu náboja v pascových stavoch, ktoré sa zvyčajne vytvárajú na hraniciach zŕn.

Tenké vrstvy Al2O3 pripravené nanášaním po atomárnych vrstvách (atomic layer deposition, ALD) boli využité na ochranu katódy s aktívnym materiálom LiFePO4 a s hrúbkou 70 ?m. Elektrochemické merania nabíjania/vybíjania v konfigurácii s Li anódou (half-cell configuration) ukázali, že pokles kapacity pri vybíjaní prúdom 2 C je kompenzovaný ochrannou ALD vrstvou. Ukazuje sa, že veľmi tenké vrstvy Al2O3, pripravené technológiou ALD zabraňujú priamemu kontaktu elektródy s elektrolytom, potláčajú postranné reakcie, zabraňujú rozpúšťaniu materiálu katódy a súčasne vylepšujú transfer Li-iónov cez rozhranie elektródy.

V sérii príspevkov sme využili vyvinuté techniky nekonvenčného spracovania nových materiálov pripravených rýchlym ochladením taveniny na cielené riadenie výsledných, najmä štruktúrnych, magnetických, magnetomechanických a chemických vlastností (články v J. Thermal Analysis and Calorimetry, Materials, J. Magn. Magn. Mater., AIP Conf. Proc.). Ukázali sme, že rýchle a ultrarýchle žíhanie je popri energetickej účinnosti v dôsledku krátkej doby žíhania vysokoefektívne na dosiahnutie zníženia rozmerov nanokryštalických zŕn kryštalizujúcich v amorfnej matrici s dôsledkom výrazného zníženia magnetickej koercivity vedúcim k získaniu kvalitných magneticky mäkkých materiálov (materiály na báze Fe-Sn-B, obhájenie dizertačnej práce, Fe-B, a pod., prezentácie na konferenciách, publikácie v J. Magn. Magn. Materials).

Preeskúmali sme účinky žíhania v externom magnetickom poli poľa na magnetické vlastnosti, doménovú štruktúru a magnetoimpedančné parametre amorfných a nanokryštalických tenkých

pások so zložením (Fe3Ni)81Nb7B12 (publikácia v Chemosensors). Cieľom týchto experimentov bolo zvýšenie citlivosti GMI charakteristík týchto magneticky mäkkých pások na malé zmeny okolitého magnetického poľa. Výsledky našich experimentov ukázali, že vzorky v nanokryštalickom stave vykazujú podstatne vyššie hodnoty GMI efektu v porovnaní s východiskovým amorfným materiálom. Citlivosť GMI voči aplikovanému poľu bola najvyššia v prípade nanokryštalickej pásky žíhanej v priečnom magnetickom poli kde parameter ? = d(?Z/Z)/dH dosiahol hodnotu 15%/Oe.

K prínosom špičkového významu patrí aj príprava nových typov zliatin a demonštrácia využitia chemickej, fázovej a štruktúrnej analýzy pre stanovenie štruktúry a atomárneho usporiadania takýchto nových materiálov, najmä zliatin s vysokou entropiou, poréznych katalytických systémov ušľachtilých kovov (Pd, Pt a pod.) vzniknutých selektívnym odlegovaním matrice napr. Zn, keramík obsahujúcich vysokoentropické karbidy a boridy kovov, nanosystémoch na báze nanočastíc typu core-shell a pod.

Pre validáciu takejto unikátnej metódy bol ako modelový systém štruktúrnej analýzy so zameraním na detailný popis a určenie lokálneho chemického a fázového zloženia vybraný vysoko-entropický keramický materiál s dvoj-zložkým fázovým zložením. Hlavné zložky systému boli tvorené fázami na báze vysoko-entropického boridu (HEB) a karbidu (HEC). Systém bol chemicky charakterizovaný od mikro až po atomárnu škálu, kde bola jednoznačne potvrdená chemická homogenita rozloženia príslušných prvkov v daných mriežkových systémoch. Štúdium fázových rozhraní jasne poukázalo na prítomnú semi-koherenciu v definovaných orientáciách medzi jednotlivými fázami (HEB a HEC). Na základe výsledkov boli navrhnuté modely distribúcie cudzích prvkov a prímesí na fázových rozhraniach vo forme tenkých temer mono-atomárnych vrstiev alebo zhlukov. Diskutované boli taktiež lokálne narušenia kryštalickej mriežky v oboch systémoch spôsobené variáciou lokálneho chemického obsadzovania základnej kryštalickej bunky. Získané výsledky poskytujú unikátny pohľad nutný na správnu interpretáciu vlastností vlastných pre vysoko-entropické systémy a zároveň potvrdzujú úspešnú validáciu metódy. Táto bola ďalej aplikovaná aj na detailnú analýzu atomárneho usporiadania v konvenčnejsích systémoch rýchlochladených zliatin kov-polokov. Získané výsledky boli úspešne prezentované v publikáciách v Journal of the European Ceramic Society, ACS Applied Materials & Interfaces, Journal of Science: Advanced Materials and Devices a vo viacerých konferenčných príspevkoch vrátane pozvaných prednášok.

Preštudovali sme stabilitu fáz v binárnych systémoch Al-Pd, Pd-Mn a Al-Pd a v ternárnom systéme Al-Pd-Mn. Vypočítali sme jednotlivé tvorné entalpie pomocou metódy DFT z prvých princípov.

Vo väčšine prípadov bol zistený súlad medzi vypočítanými a experimentálne stanovenými hodnotami Delta_H. V prípade ternárnych fáz sa zistilo, že žiadna z kryštalických fáz nie je predikovaná ako stabilná fáza. Naopak, v systéme Al-Pd-Mn sa predpokladá, že stabilnejšie sú kvázikryštalické aproximanty. Ide predovšetkým o ikosaedrálne a dekagonálne kvázikryštalické aproximanty (publikácia v RENDICONTI, ďalšie výsledky v pozvanej prednáške ako spoluator a prednáške na konferencii ICQ15).

V rámci projektu bol vytvorený atómový model kvázikryštalického aproximantu epsilon_28 v systéme Al-Pd-Co. Model bol vypočítaný pomocou metódy VASP (Vienna ab initio simulation package). Zistilo sa, že základná bunka epsilon_28 pozostáva z 277 atómov of Al, 84 atómov Pd a 16 atómov Co. Následne boli vypočítané mriežkové parametre a vytvorený štandardizovaný CIF súbor epsilon_28 (publikácia v AIP Conf. Proc.)..

Pomocou modelov rozhrania podrobených ab-initio molekulárnemu dynamickému žíhaniu sme analyzovali a predpovedali koherentosť rozhraní medzi diamantovými a klatrátovými štruktúrami. Ukázali smem že rozhrania sú stabilné až do teplôt, ktoré sa blížia k bodu topenia základných systémov a v niektorých študovaných prípadoch je väzba diamant/klatrát silnejšia ako väzba intraklatrát, ako dokazujú simulované experimenty s trhlinami. Zistili sme, že zložením kalibrované mriežkové párovanie môže stabilizovať dokonca aj metastabilné klatráty ako epitaxne pestované filmy na substráte diamant/zincblende (publikácia v Computational Materials Science).

Preskúmali sme kinetiku rastu intermetalických vrstiev spoja Cu/Sn-3.5Ag s rôznym obsahom keramických nanočastíc ZrO2 pri izbových teplotách a teplotách blízko operačným teplotám spojov (453 K). Ukázali sme, že obsah nanokeramiky do 1 váhového percenta vedie k spomaleniu rastu intermetalických častíc v priestore rozhrania spoja a spájky a k zmene ich morfológie z hrebenatej na spojitú v dôsledku znízenia hnacej sily pre rast a k zmene typu majoritnej fázy z Cu6Sn5 na Cu3Sn. Jav sme spojili so zmenou efektívneho difúzneho koeficientu zložiek a jeho znížením aj pri zvýšených teplotách (publikácia v Applied Nanoscience, prednáška na konf. IMC-XV, poster na konf. Navrhli sme model, v ktorom sa 6-stavový clock model anizotropne deformuje na Pottsov model. Pomocou metódy Corner Transfer Matrix Renormalization Group sme navrhli tenzorovú sieť so zdeformovanými spinovými interakciami. Zistili sme, že dochádza k postupnému oslabovaniu dvoch fázových prechodov typu Kosterlitz-Thouless. Tieto sa stretávajú v trikritickom bode a menia na nespojitý fázový prechod prvého rádu. Klasifikovali sme triedu univerzality trikritického bodu a načrtli možné scenáre vzniku fázových prechodov tretieho a vyššieho rádu [10.1016/j.physa.2023.128907].

Zamerali sme sa na netriviálne vlastnosti fraktálnych štruktúr, kde lokálne merania vedú k diametrálne odlišným výsledkom. Zadefinovali sme spôsob merania globálnych fyzikálnych vlastností pomocou „automatickej diferenciácie“ tenzorovej siete v metóde Higher-Order Tensor Renormalization Group. Globálneho merania spontánnej magnetizácie je experimentálne merateľné a je výrazne odlišné od lokálnych meraní [10.1103/PhysRevE.107.044108].

V poslednom polroku riešenia projektu pribudla jedna publikácia. Nie všetky kvantové procesy vzniknú zložením iných kvantových procesoch.Hovoríme, že existujú tzv. nerozdeliteľné kvantové procesy. V analógii s násobením čísel tieto kvantové procesy pripomínajú prvočísla. V článku [PRL 130, 080801 (2023)] sme si položili otázku, ktoré "zložené" procesy vieme napísať vynásobením striktne konečného počtu takýchto "prvočíselných" procesov. Výsledkom je, že pre prípad qubitových procesov a všeobecných generických procesov (t.j. až na množinu miery nula) všetky procesy sú alebo nerozdeliteľné, alebo rozdeliteľné na nekonečne veľa procesov. Dôkaz je založený na zavedení novej dekompozície kvantových procesov.

Preskúmali sme v širokom rozsahu význam dopovanie bezolovnatých spájok nanoobjektami (oxidy kovov, uhlíkové nanočastice, kovové nanoprášky a pod.) na mikroštruktúru a pevnosť spojov pri nízkych teplotách, izbových teplotách a zvýšených teplotách blízkych medzným pracovným teplotám.

Spravili sme prvé štúdie pripraviteľnosti bezolovnatých spájok vyvinutých s využitím princípu vysokej entropie (High Entropy Alloys, HEA) na získanie spájok s netradičnými teplotnými, mechanickými a koróznymi vlastnosťami.
Podobne sme pripravili zliatiny typu HEA so zložením Fe-Co-Ni-Al-Mn a variáciou obsahu vybraných prvkov od ekvimolárneho, najmä vrajomnou variáciou pomeru Al/Mn a dolegovaním šiestym prvkom, menovite Cr, Cu alebo V. Výsledné zliatiny boli pripravené v troch rozdielnych termodynamických stavoch pomocou konvenčného tuhnutia, rýchleho ochladenia taveniny a odlievania do valcovej alebo kónickej formy. Ukázali sme, že použité substitúcie vo väčšine prípadov vedú k monofázovosti výslednej štruktúry a potvrdzujú tak počiatočný predpoklad o zachovaní vysokej konfiguračnčj entropie systémov (poster, konf.
